

Executing Python Boto3 Scripts with Default AWS CLI Profile

- Default Profile ?
 - Command to configure profiles:
 - `aws configure --profile <profileName>`
 - If we configure this without passing `--profile` then creds stores under default profile
- If you have the default profile configured, you don't need to explicitly create a session in Boto3:
- General Steps to create a client for any serviceName are:
 - `session = boto3.Session(profile_name='profileName' )`
 - `client = session.client(service_name='serviceName')`
 - Note:
 - if profileName is default then instead of above two steps we can also use as one step:
 - ❖ `client = boto3.client(service_name='serviceName')`
 - ❖ `resource = boto3.resource(service_name='serviceName')`
 - if profile_name='default' is missing or not configured properly, using `boto3.client('ec2')` without setting up credentials will fail with a credentials-related error.
- Notes:
 - Use Default Profile when you are working with only single AWS Account or one IAM User
 - Use Named Profiles when you are working with Multiple AWS Accounts or Multiple IAM Users
