

Creating Client & Resource from session for AWS Services

- The client and resource concepts in Boto3 are the primary interfaces used to interact with AWS services programmatically
- we create client and resource using a session
 - `session = boto3.Session(profile_name='dev')`
 - Creating a Client for IAM Service:
 - `iamClient = session.client(service_name='iam')`
 - Creating a Resource for IAM Service:
 - `iamResource = session.resource(service_name='iam')`

Notes:

- resource is not available for all AWS services
- `print(boto3.Session().get_available_resources())` -> It Display the AWS Services for which resource is available
- Or try: `boto3.Session().resource(service_name='lambda')` and see the result
- Or : We can also verify from boto3 official documentation
- You can always use client as a fallback when resource is not available

Differences between client and resource concepts

- In Boto3, session, client and resource are Python Objects created from classes

Feature	Client	Resource
Interface Level	Low-level	High-level, Object-oriented
Availability	Available for all AWS services	Available only for a few services (e.g., EC2, S3, IAM)
Method Naming	Matches AWS API names (e.g., <code>describe_instances</code>)	More Pythonic (e.g., <code>instances.all()</code>)
Response Format	Returns raw dictionaries (JSON-like)	Returns resource objects you can interact with
