

Meta Concept of Boto3:

- Meta is an attribute attached to client and resource objects
- It provides access to low-level service metadata like
 - Service name
 - Region
 - API version
 - Endpoint URL
 - Operation Names etc...

- Note: The `client.meta` object in Boto3 provides more metadata and operational access compared to `resource.meta`. However, we can access all client-level metadata and operations from a resource object by using `resource.meta.client`
