

Introduction to Boto3 CRUD Operations for Multiple AWS Resources

- Multiple AWS Resources means like IAM Users, IAM Roles, IAM Policies, EC2 Instances, S3 Buckets...
 - When working with multiple AWS resources using Boto3, CRUD Operations can be classified into two types:
 - They are:
 - Known Resources Operations:
 - You already know the exact resource Name's or ID's (e.g., an EC2 Instance IDs, S3 Bucket Names or Lambda Function Names)
 - You can directly execute create, read, update and delete operations by using Loops with Single AWS Resource Concepts
 - Unknown Resources Operations:
 - You don't know the resource Name's or ID's beforehand
 - You first need to list or search for the resources (e.g., list all EC2 instances or S3 buckets) using `paginators/collections/filters` and then execute create, read, update and delete operations
- In short:
- If you know the resource Name's/ID's → you act directly by using Loops with Single AWS Resource Concepts
 - If you don't know the resource Name's/ID's → you first discover them using (`paginators/collections/filters`) and then act on them
