

Introduction to Boto3 Client Filters

- Boto3 Client filters are primarily used with read operations
- Boto3 client filters are useful to narrow down results when querying Multiple AWS Resources
- Simply, Filters allow you to retrieve only specific resources based on defined conditions
- Note: Filters are not standardized across all AWS services – each service may support different filter keys, structures and usage patterns
- Example:

```
Filters=[]      parameter for AWS Services like EC2, RDS, ELB  
PathPrefix=''  parameter for AWS Service IAM  
Prefix=''      paramter for S3
```
- Notes:
 - All these filters are useful to filter data before fetching results into our code
 - We may need Manual Python Filtering in our code after fetching data
