

Boto3 Client Script To Identify and List Untagged EC2 Instances

- Keeping tags for EC2 instances is very important
- Tags help us easily identify which instances belong to production and which ones are for non-production - especially when you're using the same AWS account for both.
- Tags also help us group resources based on projects and teams
- Without tags, managing resources becomes confusing and hard to automate or track
- So that's why, generally for auditing purposes, we look for untagged EC2 instances
