

Get All IAM Users Details from a Given AWS Account using Client

- In real-time AWS environments, we usually don't know exactly how many IAM users exist without checking the AWS Console
- Additionally, new IAM users can be created or deleted at any time - so you may have 0 to any number of IAM Users
- So, this is an Unknown Multiple AWS Resources Operation concept
- And also, It's a Read Operation for Unknown Multiple AWS Resources

Notes for Boto3 Scripts

- Single AWS Resource:
 - Client Operations:
 - Create Operations : create/put/allocate/add...
 - Read Operations : get/list/describe ...
 - Update Operations : update/modify ...
 - Delete Operations : delete/remove/terminate ...
 - Client CRUD Operations return results as a dictionary/JSON Data
 - So, we need dictionary operations to parse result
 - Resource Operations:
 - CRUD Operations are using single AWS Resource object
 - CUD Operations are executed with Actions on Single AWS Resource Object
 - Note: If you don't find action for create from single AWS Resource object then execute from Resource action
 - CUD Operations return results as a dictionary or list or list of objects
 - R Operations are executed with the help of Identifiers and Attributes
- Known and Unknown Multiple AWS Resources:
 - Known multiple AWS resource operations are performed using Single AWS Resource operations inside loops
 - Unknown multiple AWS resources are retrieved using paginators, collections or filters and update or delete operations are performed using Single AWS Resource operations inside loops
 - Note: We may get Unknown Single AWS Resource result while working with Unknown Multiple AWS Resources
