

How to Identify if a Method Needs Paginator Logic to Read All Data or Not ?

- Paginator logic is for Client Read Operations and Paginator logic is required when a Read operation can return multiple pages of data, typically in the case of large datasets
- However, not all Read methods return data in pages
- so, paginator logic is needed only for certain Read operations, not for all
- So, How to identify if a method needs Paginator logic to Read All Data or Not ?
- Solution:
 - Step-1: Go to the Boto3 client documentation for the required AWS service (like IAM, S3, EC2, etc.)
 - Step-2: Look at the read method you are calling : If the method mentions MaxItems, NextToken, Marker, ContinuationToken, or Pagination – then it supports pagination
 - Step-3: If the Read Operation Or Method Supports Pagination then use logic as :

```
responses=[]
response = iamClient.list_users( MaxItems=1000)
responses.append(response)
Marker = response.get('Marker')

while Marker:
    response = iamClient.list_users( MaxItems=1000, Marker=Marker)
    responses.append(response)
    Marker = response.get('Marker')
```

Notes:

- This loop keeps fetching next pages automatically, and it stops when there are no more pages left.
- Each Page Response is same as sample response
