

Types of Boto3 Client Paginators

- Pagination is the process of dividing large results into smaller, more manageable chunks called “pages”
- Paginator is a logic or mechanism to handle all pages to read the complete data efficiently
- There are two types of paginators in boto3 client
- They are:
 - Custom Paginators
 - Built-in or Default Paginators
- Steps to Use Built-in Paginators: `list_users`
 - Step-1: Verify whether `list_users` requires pagination, and if so, check whether a default paginator is available for it
 - Step-2: Create a paginator as:
 - `paginator = client.get_paginator('method_name')`
 - Step-3: Call paginator to get all pages as:
 - `response_iterator = paginator.paginate()`
(or)
 - `pages = paginator.paginate()`
(or)
 - `responses = paginator.paginate()`
 - Step-4: Now apply for loop to read all pages data from `pages/response_iterator/responses`
